

# TestkingPDF

Try before you buy

Download a free sample of any of our exam questions and answers

 Download Demo

- ✓ 24/7 customer support, Secure shopping site
- ✓ Free One year updates to match real exam scenarios
- ✓ If you failed your exam after buying our products we will refund the full amount back to you.

## Quality and Value

TestkingPDF Practice Exams are written to the highest standards of technical accuracy, using only certified subject matter experts and published authors for development - no all dumps.

## Tested and Approved

We are committed to the process of vendor and third party approvals. We believe professionals and executives alike deserve the confidence of quality coverage these authorizations provide.

## Easy to Pass

If you prepare for the exams using our TestkingPDF testing engine, It is easy to succeed for all certifications in the first attempt. You don't have to deal with all dumps or any free torrent / rapidshare all stuff.

## Try Before Buy

TestkingPDF offers free demo of each product. You can check out the interface, question quality and usability of our practice exams before you decide to buy.

Valid test online & stable pass king & latest PDF dumps

**Exam :** 70-241

**Title :** TS: Developing Business Process and Integration Solutions by Using Microsoft BizTalk Server 2006 R2

**Vendors :** Microsoft

**Version :** DEMO

NO.1 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. Now you're developing a solution. You have a receive port. It listens for XML files on a file drop, and then the files are moved to the MessageBox database as they arrive. You develop an orchestration which subscribes to all messages on the MessageBox database.

The messages have an `ErrorReport.ErrorType` property which is populated. Your partner sends you a file which is not routed to the orchestration. The files meets an exception on the receive port. In order to make messages that fail on the port will be routed to the orchestration, you have to configure the receive port.

So what should you do to achieve this?

A.For failed messages check box on the receive port, you should select the Enable routing by using the

BizTalk administration console.

B.If authentication fails check box on the receive port, you should select the Keep messages by using the

BizTalk administration consol.

C.You should create a correlation set which has the correlation type set to `ErrorReport.ErrorType` in the

orchestration. In the orchestration, set the first Receive shape to initialize this correlation set.

D.Before port processing check box and the Request message after port processing properties check box

on the receive port, you should select the Request message By using the BizTalk administration console.

Answer:A

NO.2 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You are creating an orchestration. This orchestration

will consume services from a send port. And the SOAP adapter is used by the send port.

Sometimes the

Web service URL for the send port will change. You have to provide support for the changing Web service

URL while not redeploying. First you add a new Web reference to the project by using Microsoft Visual

Studio .NET 2005. The project uses the URL of the SOAP services. So what's your next action?

A.First, you should create a new send port. The send port uses the Specify Later binding. Second, on this

new send port, you set the Port Type property to the new Web port type. Third, when the URL changes,

you set the URL by using Visual Studio.

B.First, you should create a new send port. The send port uses the Specify Later binding. Second, on this

new send port, you set the Port Type property to the new Web port type. Third, when the URL changes,

you set the URL by using the BizTalk administration console.

C.You should create a new send port that uses the Specify Now binding. Set the URI and Transport

properties for the new send port. Create a new port type. Use the BizTalk administration console to set the

URL when it changes.

D.First, you should create a new send port. The port uses the Specify Now binding. Second, you set the

URI and Transport properties for the new send port and on this new send port, set the Port Type property

to the new Web port type. Third, when the URL changes, you set the URL by using Visual Studio.

Answer:B

NO.3 You work in an international company which is named TXTWIN. And you're in charge of the company

network and use Microsoft BizTalk Server 2006 R2. You store all client information in a single table by

using Microsoft SQL Server 2005. The structure of the table never changes. But in the database, the

security policy forbids new stored procedures to be created. The use of dynamic SQL is not allowed either.

So what should you do to insert a new client record in the table?

A.You should send updategrams by using the SQL adapter.

B.You should call the sp\_executeSQL stored procedure by using the SQL adapter.

C. You should configure the SQL adapters ConnectionString property and make the usage of Trusted

Security included.

D. You should configure the SQL adapters ConnectionString property and make the usage of Security

Support Provider Interface (SSPI) included.

Answer: A

NO.4 You work in an international company which is named TXTWIN. And you're in charge of the company

network and use Microsoft BizTalk Server 2006 R2. You develop three schemas all of which have a

property named AccountID. They're respectively named Account, AccountOrder, and AccountAnswer.

Now you create an orchestration which performs the following steps in sequence, the orchestration

contains one Send shape, two Receive shapes, and several other shapes. First, the orchestration

receives an incoming document, and the document matches the Account schema, second it maps the

incoming document to the AccountOrder schema, and then it sends the AccountOrder message to the

MessageBox database, receives messages that match the AccountAnswer schema back from the

MessageBox database. At last if the AccountAnswer message indicates any errors, it logs a message to

the event log. You develop a correlation set named CorrelationAccountID and a correlation type. Both of

them re on the basis of the AccountID property. Now you have been assigned a task that you must ensure

that multiple instances of the orchestration can run simultaneously, besides this, you must make sure that

each one can process a unique account ID. In order to assure this, what actions should you do? (choose

more than one)

A. On the Send shape, you should initialize CorrelationAccountID.

B. On the first Receive shape, you should initialize CorrelationAccountID.

C. On the second Receive shape, you should initialize CorrelationAccountID.

D. On the second Receive shape, you should set the Following Correlation property. Make it be equal to

CorrelationAccountID.

E. On the Send shape, you should set the Following Correlation property. Make it to be equal to

CorrelationAccountID.

Answer: A D

NO.5 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You create a solicit-response HTTP port. Documents

meet errors in the incoming pipeline. An error status code of 500 is returned and the incoming message is

deleted. You must make sure that when incoming messages meet errors during pipeline processing, an

error status code of 202 is returned. Besides this, you must make sure that the incoming messages arrive

on the MessageBox database. So what should you do to achieve this?

A. On the HTTP receive location, you should select the Suspend failed requests check box.

B. If authentication fails option on the HTTP receive port properties, you should enable the Keep messages.

C. You should enable the Enable routing for failed messages option on the HTTP receive port properties.

D. On the HTTP receive location, you should select the Loopback check box. On the HTTP receive port

properties, enable all inbound tracking options.

Answer: A

NO.6 You work in an international company which is named TXTWIN. And you're in charge of the company

network and use Microsoft BizTalk Server 2006 R2. The PassThru receive pipeline is used by a receive

port. Inbound SOAP messages are not being validated against schemas. At the earliest stage in the

receive pipeline, what should you do to validate the messages against the envelope and body schemas?

- A. First, you should configure the receive port and make it use the default XML receive pipeline. Second, the EnvelopeSpecNames property of the pipeline should be set to the envelope schema.
- B. First, you should create a custom receive pipeline. Add an XML validator in the Validate phase. Then configure the receive port and make it use the custom receive pipeline. Before you perform this, the Document schemas collection should be set to the envelope and body schemas.
- C. First, you should create a custom receive pipeline and add an XML disassembler in the Disassemble phase. And then configure the receive port and make it use the custom receive pipeline. Before you perform this, you should set the envelope and body schemas and the Validate document structure property should be set to True.
- D. First, you should create a custom receive pipeline and add a flat file disassembler in the Disassemble phase. And then configure the receive port and make it use the custom receive pipeline. Before you perform this, the Validate document structure property should be set to True and you should set the envelope and body schemas.

Answer:C

- NO.7 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. Now you're developing a solution. You use the Business Rule Composer to create several rules. From BizTalk RFID you call the Business Rules Engine (BRE). There are test input XML instances that are stored in different files. Now you have to use them to test the rules. So what should you do?
- A. You should run the Rule Engine Deployment Wizard.
- B. You should use the BTSTask.exe command-line utility.
- C. In the Business Rule Composer, you should use the Policy Explorer.
- D. In the RFID Manager, you should use the RuleEnginePolicyExecutor event handler.
- E. In Health and Activity Tracking (HAT), you should use the Orchestration Debugger.

Answer:C

NO.8 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You develop an orchestration which performs the following: 1. Perform mapping 2. Process files from a receive port 3. Send a message to a business partner. The orchestration is running and the receive port is enabled, but the associated send port is unenlisted. A text file is dropped in the receive location. The message is not sent to your business partner despite that the orchestration finishes successfully. So what should you do to make sure that your business partner can receive the message?

A.First, you should disable all breakpoints by using Health and Activity Tracking (HAT).

Second you resubmit the file.

B.First, you should save the message to a file directory by using Health and Activity Tracking (HAT).

Second you resubmit the file.

C.First, you should start the send port by using the BizTalk administration console. Second, you resume the suspended message.

D.First, you should resume the suspended message by using the BizTalk administration console. Second, you enable the receive location and resubmit the file.

Answer:C

NO.9 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You develop an orchestration which contains several steps. You intend to use Business Activity Monitoring (BAM) to track the orchestration. You create a BAM definition. The BAM definition has several activities. What should you do to modify the dimensions that are associated with these activity components?

- A. You should utilize the Tracking Profile Editor (TPE).
- B. You should modify the Pivot Table Field List by using Microsoft Excel.
- C. You should use the Business Activity Monitoring Activity Definition Wizard.
- D. You should create a new rule in the policy by using the Business Rule Composer.

Answer: C

NO.10 You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You have two schemas respectively named NewOrder1.xsd and NewOrder2.xsd. Both of them are related to order processing. Messages that adhere to NewOrder1.xsd are created by an order processing system and are delivered using a File receive port. Messages that adhere to NewOrder2.xsd are created by a financial system and are delivered using an FTP receive port. Both schemas have a promoted property named OrderID. You implement a parallel convoy by using an orchestration. A Parallel shape which contains two Receive shapes is created. You connect the Receive shapes to the receive ports. You base the Receive shapes and the receive ports on one of the two message types. Now you must make sure that when an identical value is present in the OrderID element, the same orchestration instance will receive both the message types. So what should you do to ensure this?

- A. First, you should create a correlation type which is based on the OrderID property. And create a correlation set which is based on the correlation type. Second, you set both Receive shapes to initialize the correlation set and both Receive shapes Activate property to True.
- B. First, you should create a correlation type which is based on the OrderID property and create a correlation set which is based on the correlation type. Second, both Receive shapes should be set to initialize the correlation set and both Receive shapes Activate property should be set to False.

C. First, you should create a correlation type which is based on the OrderID property and create two correlation sets which are based on the single correlation type. Second, each Receive shape should be set to initialize one of the correlation sets and both Receive shapes Activate property should be set to True.

D. First, you should create a correlation type which is based on the OrderID property and create two correlation sets which are based on the single correlation type. Second, each Receive shape should be set to initialize one of the correlation sets and one Receive shapes Activate property should be set to True and the other Receive shapes Activate property to False.

Answer:A
